

Turning Chaos into Control - Omada Launches SharePoint Governance Manager

Denmark, April 15th, 2009 – Omada, a leading Microsoft Solution Provider within Identity and Secure Access, today announced the availability of ‘Omada SharePoint Governance Manager’. The solution is built on top of Omada’s award-winning Role Engine for Advanced Role Based Access Control (RBAC).

Omada’s SharePoint Governance Manager introduces a solution for easy governance of SharePoint through role-based automation of user and site administration. The unique solution ensures easy management of user permissions and sites across SharePoint farms, intranets and extranets.

“SharePoint is a great asset for many companies, connecting people, information and processes,” said Morten Boel Sigurdsson, CEO of Omada. “However, if implemented without adequate attention to Governance and the enforcement of policies, administration of SharePoint can quickly become difficult, leading to inefficient use, increased costs and security risks.

“Omada SharePoint Governance Manager realizes the full potential of SharePoint through effective implementation of user permissions and site creation policies. The solution delivers a secure and high-performance workspace for employees and business partners, providing fast Return on Investment,” continues Sigurdsson.

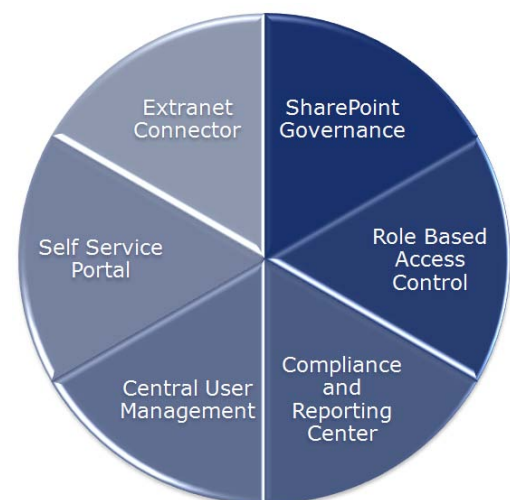

The Governance Manager can be deployed as a standalone solution for SharePoint, providing a very fast implementation and return on investment. The solution also seamlessly integrates with the Omada Identity Manager, providing an efficient upgrade path or integration scenario to support an enterprise-wide identity management strategy.

About Omada SharePoint Governance Manager

Omada SharePoint Governance Manager comes with unique features – each addressing key areas of SharePoint Governance to accomplish easy administration, strong security and compliance, and productive business users. The Governance Manager enables:

Efficient Implementation of SharePoint Governance for Easy Administration

- Stay in control with automated site creation process and approval workflows
- Save time with automated, role-based management of user permissions and request-based provisioning
- Achieve one central point for SharePoint administration across multiple SharePoint farms and centralized management of partner, employee, and customer permissions in extranet scenarios

Strong Security and Simple Compliance Reporting

- Remove security risks by ensuring that user permissions are consistent across multiple portals
- Use standard reports that let you easily respond to compliance reporting needs and internal audits

Productive Business Users

- Full trust in sharing information on SharePoint, enabling efficient collaboration
- Internal and external information workers have the right access rights at all times – no time wasted
